

AUSTRALIAN PURPLE TOP turnip

- **Summer turnip, 12-14 + weeks to maturity**
- **Certified alternative to Mammoth purple top turnip**
- **Australian selection**
- **Improved drought tolerance**
- **Improved tolerance to Diamondback moth (Cabbage moth)**

AUSTRALIAN PURPLE TOP is the latest brassica to come from the PGG Seeds Ceres breeding programme. It is a Victorian selection from the old, reliable, English bred, uncertified Mammoth purple top turnip.

Mammoth purple top is a purple top-white base, tankard-type turnip used traditionally in harder, drier regions, for summer feed. The key advances of the Australian selection are improved drought and Diamondback moth tolerance.
